

SANI-CLOTH®

Disinfection of Computer Keyboards

What's growing on your keyboard?

Recommendations for disinfection of computer keyboards^{1,2}:

In the office, patient testing area, nursing unit or at the patient bedside, the computer keyboard can serve as a reservoir for pathogenic microorganisms.

- Transmission of pathogens present in environments of patients infected or colonized with MRSA, VRE and Clostridia difficile are of special concern
- Computer keyboards can serve as reservoirs for cross transmission of microorganisms such as bacteria, viruses and fungi
- Contaminated computer keyboards can serve as a mechanism for contaminating hands of healthcare workers
- Studies have shown microbial contamination of computer keyboards is prevalent¹
- Computer keyboards can be successfully decontaminated using Sani Cloth®
- Sani-Cloth® demonstrated excellent sustained activity against VRE and antimicrobial activity was maintained over the entire 48-hour test period¹

- Always check with equipment manufacturer for recommended disinfectant chemicals
- Do not touch keyboards with contaminated hands
- Disinfect computer keyboards daily and when visibly soiled
- Computers should remain in rooms of patients in isolation precautions
- Mobile computers should be disinfected prior to entry and upon exit of patient room/area
