

PDI Makes Hygea[®] Flushable Personal Cleansing Cloths More User- and Environmentally-Friendly

(Orangeburg, NY, December 5, 2011) – PDI, provider of infection prevention solutions for healthcare facilities, introduces significant enhancements to its Hygea[®] Flushable Personal Cleansing Cloths. The redesign makes the product safer for the environment and more user friendly for healthcare workers and patients.

The primary improvement is the new Ecosperse[™] dispersible cloth technology that easily breaks apart after flushing, making Hygea Flushable Cloths safer than ever for sewers and septic systems. The cloths now contain 88 percent biodegradable fibers and the new soft packaging, requires 70 percent less plastic than before,.

An additional improvement is an easy-to-use, tissue-like dispensing technology that provides quick, easy access to individual wipes to help prevent cross contamination. Hygea Flushable Cloths also contain a gentle and mild cleansing formula with Aloe and Vitamin E to soothe and nourish skin.

PDI offers the only complete range of infection prevention products for Environmental Hygiene (Sani-Cloth[®]), Skin Antisepsis (Chlorascrub[™]), Hand Hygiene (Sani-Hands[®]) and Patient Care (Hygea[®]), along with education and support to help reduce infection rates, control associated costs and, ultimately save lives. PDI serves hospitals, long-term care facilities, laboratories, dental and physician offices throughout the United States and worldwide. www.pdipdi.com
